

Geomec 5.5 Release Notes

Geomec 5.5 has the following new features and improvements:

- 1) Casing model
 - Improved initialization of stress
 - Non-linear geometry is now optional (default on)
 - Visualization improvements:
 - Multiple cross-sections for clipping
 - Radial scaling
 - Deformations (with scaling)
- 2) Geomec Inversion Plugin
 - Plugin system for Python programs
 - Inversion Plugin to couple Geomec and the Inversion Tool directly
- 3) Hexahedron mesh refinements
 - Refinement per formation
- 4) Calculation
 - Diana 10.2 release version is included
- 5) Geomec_shell / RGI
 - Fixed order of surfaces in export
 - Fixed regression issues / bugs and improved feedback
- 6) SKUA import / double-sided faults [EXPERIMENTAL]
 - Support of SKUA LightTSolid format (import only)
 - Support of double-sided fault import
 - Creation of intermediary fault that allows calculations
- 7) CM2 tetrahedron mesher [EXPERIMENTAL]
 - Optional meshing by CM2 meshing libraries
 - Optional repair by CM2 meshing libraries [repaired meshes don't allow calculations]
- 8) Smaller issues
 - Visual Studio 2015 run-time libraries
 - Qt libraries are upgraded to version 5.6.2
 - Open Inventor is upgraded to version 9.7.1
 - HASP license driver is upgraded to 7.60 (2017)
 - Issues with geomec_shell RGI interface have been resolved

Known issues in 5.5:

- 1) Geomec installation may fail due to Symantec virus protection

Known issues from 5.4 still present in 5.5:

- 1) GVT is an alpha test version. It doesn't support export/import of velocity files.
- 2) Qt 5.6.1 has problems with handling symbol characters. As a workaround, "°C" is currently rendered as "C", but there may be more issues.
- 3) The option to show convex hulls doesn't include cylindrical hulls yet.

Known issues from 5.3 still present in 5.5:

- 1) Contour lines are absent in the legend, and can only be shown for the property as the shading shows
- 2) Using graph ranges in the 2D wellpath view may clip the wellpath on the right, depending on Geomec's window size
