

Geomec 5.6 Release Notes

Geomec 5.6 has the following new features and improvements:

- 1) Many stability issues with Geomec on Windows 10 have been resolved
 - Specifically crashes when using cross sections (*critical bugs*)
- 2) Geomec Inversion Plugin version 2
 - The Inversion Plugin functionality has been extended
- 3) CM2 tetrahedron mesher
 - Meshing by CM2 meshing libraries is default for new models
- 4) Meshes of main and child models can be converted at the same time
- 5) Import of Earth model meshes
- 6) Wellpath and Analysis Point colors are honored in their respective views (for first result)
- 7) FIST export is activated
- 8) Small improvements and bug-fixes for zoom-in models
- 9) Help has been extended to include casing model visualization

Note: Geomec 5.6.1.5 is backward compatible with 5.6.1.3 (distributed on Linux)

Known issues in 5.6:

- 1) The Python Plugin system doesn't work with Shell's Enthought Python distribution version 7.2.2
- 2) Only one plugin can be run during a Geomec session

Known issues from 5.4 still present in 5.6:

- 1) GVT is an alpha test version. It doesn't support export/import of velocity files.
- 2) Qt 5.6.2 has problems with handling symbol characters. As a workaround, "°C" is currently rendered as "C", but there may be more issues.
- 3) The option to show convex hulls doesn't include cylindrical hulls yet.

Known issues from 5.3 still present in 5.6:

- 1) Contour lines are absent in the legend, and can only be shown for the property as the shading shows
- 2) Using graph ranges in the 2D wellpath view may clip the wellpath on the right, depending on Geomec's window size
